Operational and Maintenance Manual for TorcUP
TX-1, TX-2, TX-4, TX-8, TX-16, TX-32 and TX-45
Low Profile Hydraulic Torque Wrenches
Version 2: 2014 December

NOTICE

Series TX-1, TX-2, TX-4, TX-8, TX-16, TX-32 and TX-45 Low Profile Hydraulic Torque Wrenches are designed for installing and removing large bolts having minimal wrench clearance at offshore platforms, power plants, steel erection sites and other locations requiring precise high torque during bolt makeup and maximum torque for bolt breakdown.

TorcUP Inc. is not responsible for customer modification of tools for applications on which TorcUP Inc. was not consulted.

WARNING

**IMPORTANT SAFETY INFORMATION ENCLOSED.
READ THIS MANUAL BEFORE OPERATING TOOL.**

**IT IS THE RESPONSIBILITY OF THE EMPLOYER TO PLACE THE INFORMATION IN THIS
MANUAL INTO THE HANDS OF THE OPERATOR.**

FAILURE TO OBSERVE THE FOLLOWING WARNINGS COULD RESULT IN INJURY.

USING THE TOOL

- Always operate, inspect and maintain this tool in accordance with American National Standards Safety Code for Hydraulic Rams and Jacks (ANSI B30.1)
- This tool will function using an air or electric powered hydraulic pump. Adhere to the pump safety requirements and follow instructions when connecting the pump to the tool.
- Use only equipment rated for the same pressure and torque.
- Use only a hydraulic pump capable of generating 10,000 psig (681 bar) maximum pressure with this tool.
- Use only twin line hydraulic hose rated for 10,000 psig (681 bar) pressure with this tool.
- Do not interchange the male and female swivel inlets on the tool or the connections on one end of the hose. Reversing the inlets will reverse the power stroke cycle and may damage the tool.
- Do not use damaged, frayed or deteriorated hoses and fittings. Make certain there are no cracks, splits or leaks in the hoses.
- Use the quick connect system to attach the hoses to the tool and pump. Make certain the spring-loaded retaining rings are fully engaged and the safety rings are tightly threaded against the spring-loaded retaining rings to prevent the connectors from disengaging under pressure.
- When connecting hoses that have not been preloaded with hydraulic oil, make certain the pump reservoir is not drained of oil during start-up.

The use of other than genuine TorcUP replacement parts may result in safety hazards, decreased tool performance, and increased maintenance, and may invalidate all warranties. Repairs should be made only by authorized personnel. Consult your nearest TorcUP Authorized Service Center. Refer All Communications to the Nearest TorcUP Office or Distributor.

email: sales@torcup.com

FAILURE TO OBSERVE THE FOLLOWING WARNINGS COULD RESULT IN INJURY

Do NOT exceed Maximum Pressure. See Torque Chart with Tool. Damage May Occur.

Do not use damaged, frayed or deteriorated hydraulic hoses and fittings.

Always wear eye protection when operating or performing maintenance on this tool.

Always wear ear protection when operating this tool.

WARNING

Do not carry the tool by the hose.

Keep body stance balanced and firm. Do not overreach when operating this tool.

The Torque Reaction Arm must be positioned against a positive stop. Do not use the arm as a dead handle. Take all precautions to make certain the operator's hand cannot be pinched between the arm and a solid object.

USING THE TOOL

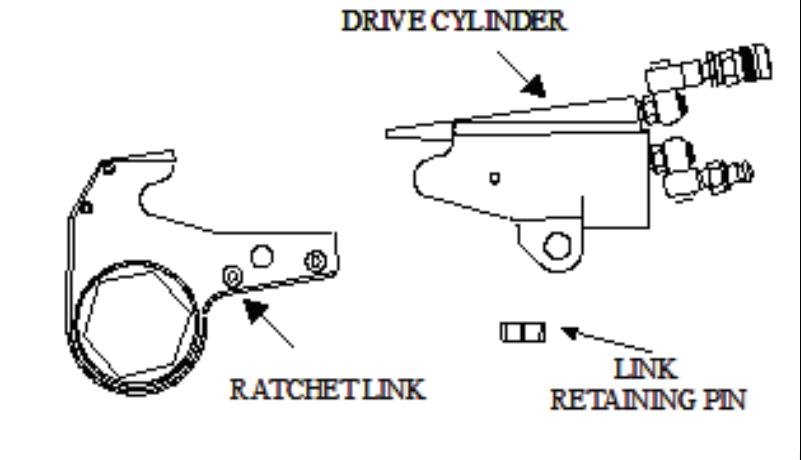

- Do not handle pressurized hoses. Escaping oil under pressure can penetrate the skin, causing serious injury. If oil is injected under the skin, see a doctor immediately.
- Never pressurize uncoupled couplers. Only use hydraulic equipment in a coupled system.
- Always wear eye protection when operating or performing maintenance on this tool.
- Always wear head and hand protection and protective clothing when operating this tool.
- Keep hands, loose clothing and long hair away from the reaction arm and working area during operation. Do not attempt to support the tool with your hands during operation.
- This tool will exert a strong reaction force. Use proper mechanical support and correct reaction arm positioning to control these forces. Do not position the reaction arm so that it tilts the tool off the axis of the bolt and never use the swivel inlets as a reaction stop.
- Avoid sharp bends and kinks that will cause severe back-up pressure in hoses and lead to premature hose failure.
- When operating a larger tool (TX-16, TX-32 or TX-45) above waist height, employ a secondary means of support for safety purposes. A tool sling or chains may be used. Consult your safety department for further suggestions.

Depending on the working environment your local health and safety regulations may require you protective gear (i.e. Ear Protection, Safety Shoes, Hard Hat, Gloves, Coveralls, etc.) In case external forces are exerted on the equipment, non-compliance with these regulations may result in injury. EAR PROTECTION MUST BE WORN WHEN OPERATING THIS TOOL.

PLACING THE TOOL IN SERVICE

CONNECTING THE TOOL

1. Attach the twin line hose to the swivel inlets of the low profile drive cylinder using the spring-loaded quick connect ends. After making certain that they are fully engaged, thread the safety rings tightly against the spring-loaded retainer rings.
2. Connect the opposite ends of the hose to the pump in the same manner.
3. Push the link retaining pin out of the low profile drive cylinder.
4. Mate the selected ratchet link to the cylinder by inserting the end of the cylinder opposite the Swivel inlets between the side plates of the ratchet link. (Refer to Dwg. 1)
5. Align the holes for the link retaining pin and insert the pin through the side plates and cylinder to keep the units joined together.

SETTING THE TORQUE

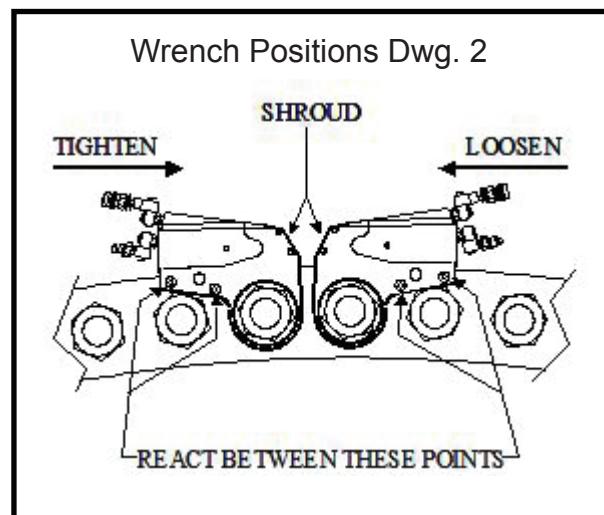

After determining the desired torque, use the torque conversion charts on pages 5 to 8 to determine the pressure that is necessary to achieve that torque.

1. Connect the tool to the power supply and turn the pump on.
2. Depress the remote control button causing the pressure to be shown on the gauge.
3. Adjust the pressure by loosening the wing nut that locks the pressure adjustment thumbscrew. Rotate the thumbscrew clockwise to increase the pressure and counterclockwise to decrease the pressure. When decreasing pressure, always lower the pressure below the desired point and then bring the gauge back up to the desired pressure.
4. When the desired pressure is reached, retighten the wing nut and cycle the tool again to confirm that the desired pressure setting has been obtained.

OPERATING THE WRENCH

The position of the tool relative to the nut determines whether the action will tighten or loosen the nut. (Refer to Dwg. 2 for application examples). The power stroke of the piston assembly will always turn the ratchet hex toward the shroud.

1. Place the ratchet hex on the nut. Make certain it is the correct size for the nut and that it fully engages the nut.
2. Position the reaction surface against an adjacent nut, flange or solid system component. Make certain that there is clearance for the hoses, swivels, and inlets. **DO NOT** allow the tool to react against the hoses, swivels, or inlets.

PLACING THE TOOL IN SERVICE

3. After having turned the pump on and presetting the pressure for the correct torque, depress the remote control button to advance the piston assembly. If the notch in the piston rod did not engage the retract pin in the ratchet link when the link was joined to the housing, it will engage the pin automatically during the first advance stroke.
4. When the link is connected to the cylinder and the wrench is started, the reaction surface of the wrench will move against the contact point and the nut will begin to turn.
5. When the nut is no longer turning and the pump gauge reaches the preset pressure, release the remote control button. The piston rod will retract when the button is released and under normal conditions, an audible "click" will be heard as the tool resets itself.
6. Continue to cycle the tool until it "stalls" and the preset psi/torque has been attained.
7. Once the nut stops rotating, cycle the tool one last time to achieve total torque.

LUBRICATION

Marine Moly Grease

Lubrication frequency is dependent on factors known only to the user. The amount of contaminants in the work area is one factor. Tools used in a clean room environment will obviously require less service than a tool used out-doors and dropped in loose dirt or sand. Marine Moly Grease is formulated not to wash out of the tool in areas where lubrication is critical. Whenever lubrication is required, lubricate as follows:

1. Separate the low profile cylinder from the ratchet link if they are joined.
2. After wiping off the old grease, apply a daub of Marine Moly Grease to the hooking notch in piston rod and wipe a film of Marine Moly Grease onto the sides and faces of the two sliders.
3. Disassemble the ratchet link as instructed in the Maintenance Section and wash the components in a suitable cleaning solution in a well ventilated area.
4. Dry the components, then wipe a film of Marine Moly Grease onto the wear surface of both side plate sleeves and the hubs of the ratchet.
5. Spread a light film of Marine Moly Grease onto the inner faces of both side plates covering the area where the drive plate and drive segment travel. DO NOT pack the teeth of the drive segment or ratchet with lube. It can prevent the teeth from engaging properly.
6. Reassemble the ratchet link as instructed in the Maintenance Section.

MAINTENANCE SECTION

WARNING

Always turn off the power supply, bleed off hydraulic fluid from the hose connections on the cylinder assembly and disconnect the hoses before attempting to repair or perform maintenance on this tool. Always wear eye protection when operating or performing maintenance on this tool.

DISASSEMBLY

GENERAL INSTRUCTIONS

1. Do not disassemble the tool any further than necessary to replace or repair damaged parts.
2. Use extra care not to score, nick or damage surfaces that will contain hydraulic oil under pressure.
3. Whenever grasping a tool in a vise, always use leather-covered or copper-covered vise jaws to protect the surface of the part and help prevent distortion. This is particularly true of threaded members and housings.
4. Do not remove any part that is press fit in or on an assembly unless the removal of that part is necessary for repairs or replacement.
5. Do not disassemble the hydraulic cylinder assembly unless you have a complete set of seals and o-rings for replacement.
6. Use only British Standard fractional size tools when disassembling these tools.

DISASSEMBLY OF THE TOOL

1. Push the link pin (12) out of the housing (1) and side plates (1 & 2).
2. Lift the housing from between the side plates and separate the two units.

Disassembly of the TX-2, TX-4, and TX-8 Cylinder Assemblies

1. Grasp the housing (1) in copper-covered or leather-covered vise jaws with the inlet end upward and using a 1/4"hex wrench, unscrew and remove the two swivel Inlets (20) with their attached couplers (21).
 2. Remove the housing assembly from the vise jaws and over a container to catch the oil, move the piston rod (3) back and forth several times to purge the hydraulic oil from the housing.
 3. Grasp the housing in copper-covered or leather-covered vise jaws with the inlet end upward.
 4. **For TX-2 use a 1/8" allen wrench. For TX-4 and TX-8 models, use a 5/32" allen wrench unscrew and remove the end cover screw (14). Remove the end cover (13).**
 5. Push the end cap (10) inward approximately 1/2" and remove the two retaining rings (11) by working them out of the groove in the cylinder.
 6. Install the seal insertion tool (22) on the inlet end of the housing.
 7. Thread one of the swivel inlets or a threaded pipe with a tee into the end cap (10). Use the inlet or tee as a handle to pull the end cap and end plug seal (17) out of the housing through the seal insertion tool.
- con't.

CAUTION

The purpose of the Seal Insertion Tool in the following step is to prevent the End Plug Seal from expanding into the Retaining Ring groove. If the Tool is not used, place 2 thin pieces of flat stock at the midpoint of the opening against opposite walls to control the Seal expansion.

MAINTENANCE SECTION

8. Invert tool above vice, spreading vice open enough to catch the end plug and piston. Placing a cloth draped between the jaws of the vice will contain the parts exiting.
9. Tap piston with a brass tap lightly until both the piston and end cap slip through the housing into the catch cloth.
10. If the rod seal or end plug seal need replacement, use a hooked tool or small screwdriver to pull it from the piston rod or end cap respectively.
11. If the rod seal (18) needs replacement, use a hooked tool to pull it out of the housing.

Disassembly of the TX-1, TX-16, TX-32 and TX-45 Cylinder Assemblies

1. Grasp the housing (1) in copper-covered or leather-covered vise jaws with the inlet end upward and using a 1/4" hex wrench, unscrew and remove the two swivel inlets (20) with their attached couplers (21). NOTE: TX-1 cylinder uses 16" whip hoses instead of swivels.
2. Remove the housing assembly from the vise jaws and over a container to catch the oil, move the piston rod assembly (3&4) back and forth several times to purge the hydraulic oil from the Housing.
3. Grasp the housing in copper-covered or leather-covered vise jaws with the inlet end upward.
4. Insert the pins of the end plug wrench (23) into the holes of the end cap (10). Using a wrench on the hex of the end plug wrench, unscrew and remove the end cap with the end plug seal (17). NOTE: the TX-1 cylinder requires a 5/8" socket to unscrew and remove the end plug.
5. Push the piston rod far enough into the housing to expose the hex on the piston head.

NOTICE

During removal and after the piston shaft is removed; DO NOT grasp the round portion of the shaft with any holding device that will damage the surface. Any nicks or scratches to the surface will allow hydraulic oil to leak from the Cylinder when the tool is reassembled.

6. Using a socket on the hex of the piston head, unscrew and remove the piston head from the shaft with the piston o-ring (19).
7. Pull the piston shaft out of the housing.
8. If the sliders (9) must be replaced, position the slider pin (16) over a clearance opening in a soft block and use a small drift to tap the pin out of the sliders and shaft.
9. If the rod seal (18) needs replacement, use a hooked tool to pull it out of the housing.

Disassembly of the Ratchet Link

1. Lay the ratchet link flat on a workbench with the left side plate (1) downward and using a hex wrench, unscrew and remove the two lower spacer screws (16).
2. Using a hex wrench, unscrew and remove the two upper spacer screws (15).
3. For series TX-16 and TX-32 models, use a roll pin punch to tap the spacer roll pin (19) out of the right side plate (2).
4. While applying thumb pressure to the edge of the ratchet (6), carefully lift the side plate off the assembly.
5. Grasp the ratchet and drive plate (3) and, while maintaining their relationship, lift them both off the left side plate.

con't.

MAINTENANCE SECTION

NOTICE

In the following step, when the Ratchet is removed from the Drive Plate, the Drive Segment and Segment Spring will be free to fall from the Drive Plate recess. Do not allow the Drive Segment to fall on a hard surface that might chip the teeth.

6. Push the Ratchet out of the drive plate and remove the drive segment (7) and the segment spring (14) from the drive plate recess.
7. If the drive pin (4) or drive pin spring (5) must be replaced, use a roll pin punch to push the drive pin spring roll pin (18) out of the drive plate. Once the pin spring is removed, the drive pin (4) will drop down to the large opening at the bottom of the slot for easy removal.
8. Lift the lower spacer (10) off the lower spacer pins (11). If the pins must be replaced, use a hex wrench to remove the two lower spacer screws from the right side plate. Pull the pins out of the holes on the inner face of the right side plate.
9. **For Series TX-2, TX-4, and TX-8 models**, unscrew the two spacer screws and remove the upper spacer (8) from the right side plate. **For Series TX-16 and TX-32 models** use a roll pin punch to remove the spacer roll pin (19) from the right side plate. Unscrew the two spacer screws and remove the middle spacer (9) and upper spacer (8) from the right side plate.
10. If the side plate sleeves (12) must be replaced, press the sleeves out toward the inner face of the side plate. NOTE: TX-1 ratchet links do not have Upper Spacers or Lower Spacers.

ASSEMBLY

General Instructions

1. Use extra care not to score, nick or damage surfaces that will contain hydraulic oil under pressure.
2. Whenever grasping a tool in a vise, always use leather-covered or copper-covered vise jaws to protect the surface of the part and help prevent distortion. This is particularly true if threaded members and housings.
3. Apply o-ring lubricant to all o-rings before final assembly.

Assembly of the Ratchet Link

1. If the side plate sleeves (12) were removed, press new sleeves, shoulder end trailing, into the right and left side plates (1 & 2) from the inner face of the side plates. Make certain the sleeves are square with the side plate faces and the shoulder of the sleeves enters the recesses in the side plates and are pressed flush with the faces.
 2. **For Series TX-2, TX-4, and TX-8 models**, position the upper spacer (8) against the inside face of the right side plate. Apply a non-permanent thread-locking compound to the threads of the two upper spacer screws (15) and secure the spacer with the screws through the side plate. **For Series TX-16 and TX-32 models** press the spacer roll pin (19) into the right side plate with one end of the pin flush with the external face of the side plate. Insert the tab of the upper spacer (8) into the slot in the middle spacer (9), and after aligning the holes in both pieces, install them on the spacer roll pin (19). When they are correctly positioned, apply a non-permanent thread-locking compound to the threads of the two upper spacer screws (15) and secure the spacers with the screws through the side plate.
 3. Insert the two lower spacer pins (11) into the holes in the lower edge of the right side plate. Apply a non-permanent thread-locking compound to the threads of the lower spacer screws (16) and secure the pins with the screws through the side plate.
 4. Place the lower spacer (10) over the pins against the side plate. Make certain it is correctly oriented so that no part of the spacer extends beyond the edge of the side plate.
- NOTE: The TX-1 ratchet links do not have Upper Spacers and Lower Spacers.

MAINTENANCE SECTION

5. Insert the drive pin (4) into the small cross-hole and slot in the drive plate (3). Invert the plate causing the ends of the pin to enter the slot and move the pin to the narrow end.
6. Position the drive pin spring (5) in the drive plate slot with the two non-connected ends between the drive pin and the large hole in the slot. Position the closed end of the spring on the opposite side of the pin and then apply pressure on the spring to align the hole through it with the hole in the drive plate for the drive pin spring roll pin (18). Insert the spring roll pin into the drive plate, through the spring and into the far wall of the drive plate.

NOTICE

In the following step, an excessive amount of grease will prevent proper tooth engagement between the ratchet and the drive segment, causing the tool to malfunction.

7. Wipe a thin film of Marine Moly Grease onto the inner face of the large opening in the drive plate.
8. Position the ratchet (6) in the central opening of the drive plate.
9. Insert the drive segment (7) into the opening adjacent to the ratchet. **Make certain the teeth of the ratchet correctly engage the teeth of the drive segment.** Reverse the ratchet if they do not properly engage.
10. Slide the drive segment sideways to expose the spring hole. Install the segment spring (14) into the hole. While compressing the spring, slide the drive segment inward until the drive plate captures the segment spring.
11. Apply a light coat of Marine Moly Grease to both sides of the drive plate and drive segment. Apply some of the Marine Moly to the inner races of both side plate sleeves (12).
12. While keeping the assembly together, insert the hub of the ratchet into the side plate sleeve of the assembled side plate.
13. Place the left side plate sleeve on the hub of the ratchet and align the screw holes for the spacers.
14. After applying a non-permanent thread-locking compound to the threads and using hex wrenches, install the two remaining lower spacer screws.

Assembly of the TX-1, TX-16 , TX-32 and TX-45 Cylinder Assemblies

1. Grasp the link retaining pin lug in copper-covered, vise jaws with the housing (1) horizontal.
2. If the rod seal (18) was removed from the housing, apply a coat of o-ring lubricant to the seal and install it, lip end trailing, in the recess at the bottom of the piston bore.
3. Press the slider pin (16) into one of the sliders (9) flush with one side. Install the pin through the hole in the piston shaft and press the remaining slider onto the pin.
4. Install the piston o-ring (19) in the groove of the piston head.
5. Insert the piston rod, threaded end leading, into the small central opening from the non-piston end of the housing. The notch in the trailing end of the shaft should be toward the ball plunger (15).
6. Insert the piston, hex end trailing, into the bore of the housing, and use socket to thread and tighten the piston onto the piston shaft.
7. Install the end plug seal (17) in the groove on the hub of the end cap (10).
8. Using the end plug wrench (23), thread the assembled end cap, o-ring end leading, into the piston end of the housing and tighten it. NOTE: The TX-1 cylinder requires a 5/8" socket to screw in and tighten the end plug.
9. Wrap the threads of the swivel sets (20) with teflon tape and thread the swivel with the male hose coupler (21) into the center of the end cap. Thread the swivel with the female coupler into the hole in the housing directly above the end cap. NOTE: The TX-1 cylinder uses 16" whip hoses instead of swivels.

MAINTENANCE SECTION

Assembly of the TX-2, TX-4, and TX-8 Cylinder Assemblies

1. Grasp the link retaining pin lug in copper-covered vise jaws with the housing (1) horizontal.
2. If the rod seal (18) was removed from the housing, apply a coat of o-ring lubricant to the seal and install it, lip end trailing, in the recess at the bottom of the piston bore.
3. Insert the piston rod, notched end leading, into the rod seal and the small central opening from the piston end of the housing. The notch in the leading end of the shaft should be toward the ball plunger (15).
4. Push the piston rod (3) inward until the hole for the slider pin (16) aligns with the holes in the walls of the housing.
5. Position one slider (9) on each side of the piston shaft and insert the slider pin through the hole in the housing into both sliders and the piston shaft. The fit between the pin and sliders is an interference fit. Use a brass hammer and drift to set the slider pin below the outer edge of both sliders or deep enough to prevent the shaft ends from dragging on the housing walls.

NOTICE

In the following step, DO NOT use thread-locking compound on the screw threads.

6. Place the seal insertion tool (22) on the inlet end of the housing.
7. Install the end plug seal (17) in the groove of the end cap (10).
8. Insert the assembled end cap into the housing through the tool with the o-ring end leading and the threaded inlet hole upward. Push the cap inward beyond the retaining ring groove and approximately $\frac{1}{2}$ " into the cylinder.
9. Remove the seal insertion tool from the housing.
10. Install the retaining rings (8) in the housing grooves at the inlet end of the housing. Install the rings with the open ends of both rings at the middle of the opening and the beveled side of the rings toward the end cap.
11. If an air hose is available, inject some air into the threaded opening of the end cap to seat the retaining rings. If air is not available, temporarily thread one of the swivel sets (20) into the threaded opening and pull the end cap back against the retaining rings to seat them.
12. For **TX-2 and TX-4 models** position the end cover (13) against the housing and after applying a non-permanent thread-locking compound to the threads, install the end cover screw (14).
13. Wrap the threads of the swivel sets (20) with teflon tape and thread the swivel with the male hose coupler (21) into the threaded hole in the end cap.
14. Apply some Marine Moly Grease to the notch in the piston rod and the face of the sliders.

Assembly of the Tool

1. With the cylinder assembly in one hand and the ratchet link in the other, hook the notch on the shaft of the piston rod (3) onto the drive pin (4) and bring the two assemblies together.
2. Insert the link pin (12) into the hole in the side plate (1 or 2) until the ball plunger (15) snaps into the annular groove around the center of the link pin.

TROUBLESHOOTING GUIDE

Trouble	Probable Cause	Solution
Piston will not advance or retract	Couplers are not securely attached to the tool or pump	Check the coupler connections and make certain that they are connected.
	Coupler is defective	Replace any defective coupler.
	Defective remote control switch	Replace the switch and/or control pendant
	Dirt in the direction-control valve of the pump unit	Disassemble the pump and clean the direction-control valve.
Piston will not retract	Hose connections reversed	Make certain the advance on the pump is connected to the advance on the tool and retract on the pump is connected to the retract on the tool.
	Retract hose not connected	Connect the retract hose securely
	Retract pin and/or spring broken	Replace the broken pin and/or spring
Cylinder will not build up pressure	Piston seal and/or end plug seal leaking	Replace any defective o-rings
	Retaining screws sheared	Replace any broken screws.
	Coupler is defective	Replace any defective coupler
Ratchet will not turn	Grease or dirt build up in the teeth of the ratchet link and drive segment	Disassemble the ratchet and clean the grease or dirt out of the teeth
	Worn or broken teeth on ratchet and/or drive segment	Replace any worn or damaged parts
Tool tightens immediately when turned on	Hose connections are reversed	Depress the advance button to release the tool; shut the pump off in the advance position and reverse the hose connection
Pump will not build up pressure	Defective relief valve	Inspect, adjust or replace the relief valve
	Air supply too low or air hose too small	Make certain the air supply and hose size comply with the pump manual recommendations.
	Electric power source is too low	Make certain the amperage, voltage and any extension cord size comply with the pump manual requirements
	Defective gauge	Replace the gauge
	Low oil level	Check and fill the pump reservoir
	Clogged filter	Inspect, clean and/or replace the pump filter
Pressure reading erratic	Defective gauge	Replace the gauge
